# Static and ELF sources - MRI, power lines, etc

Rüdiger Matthes  
Federal Office for Radiation Protection  
Germany

**6<sup>th</sup> International NIR Workshop**  
**October 14<sup>th</sup> to 17<sup>th</sup>, 2008, Rio de Janeiro, Brazil**

# Non-ionising Radiation

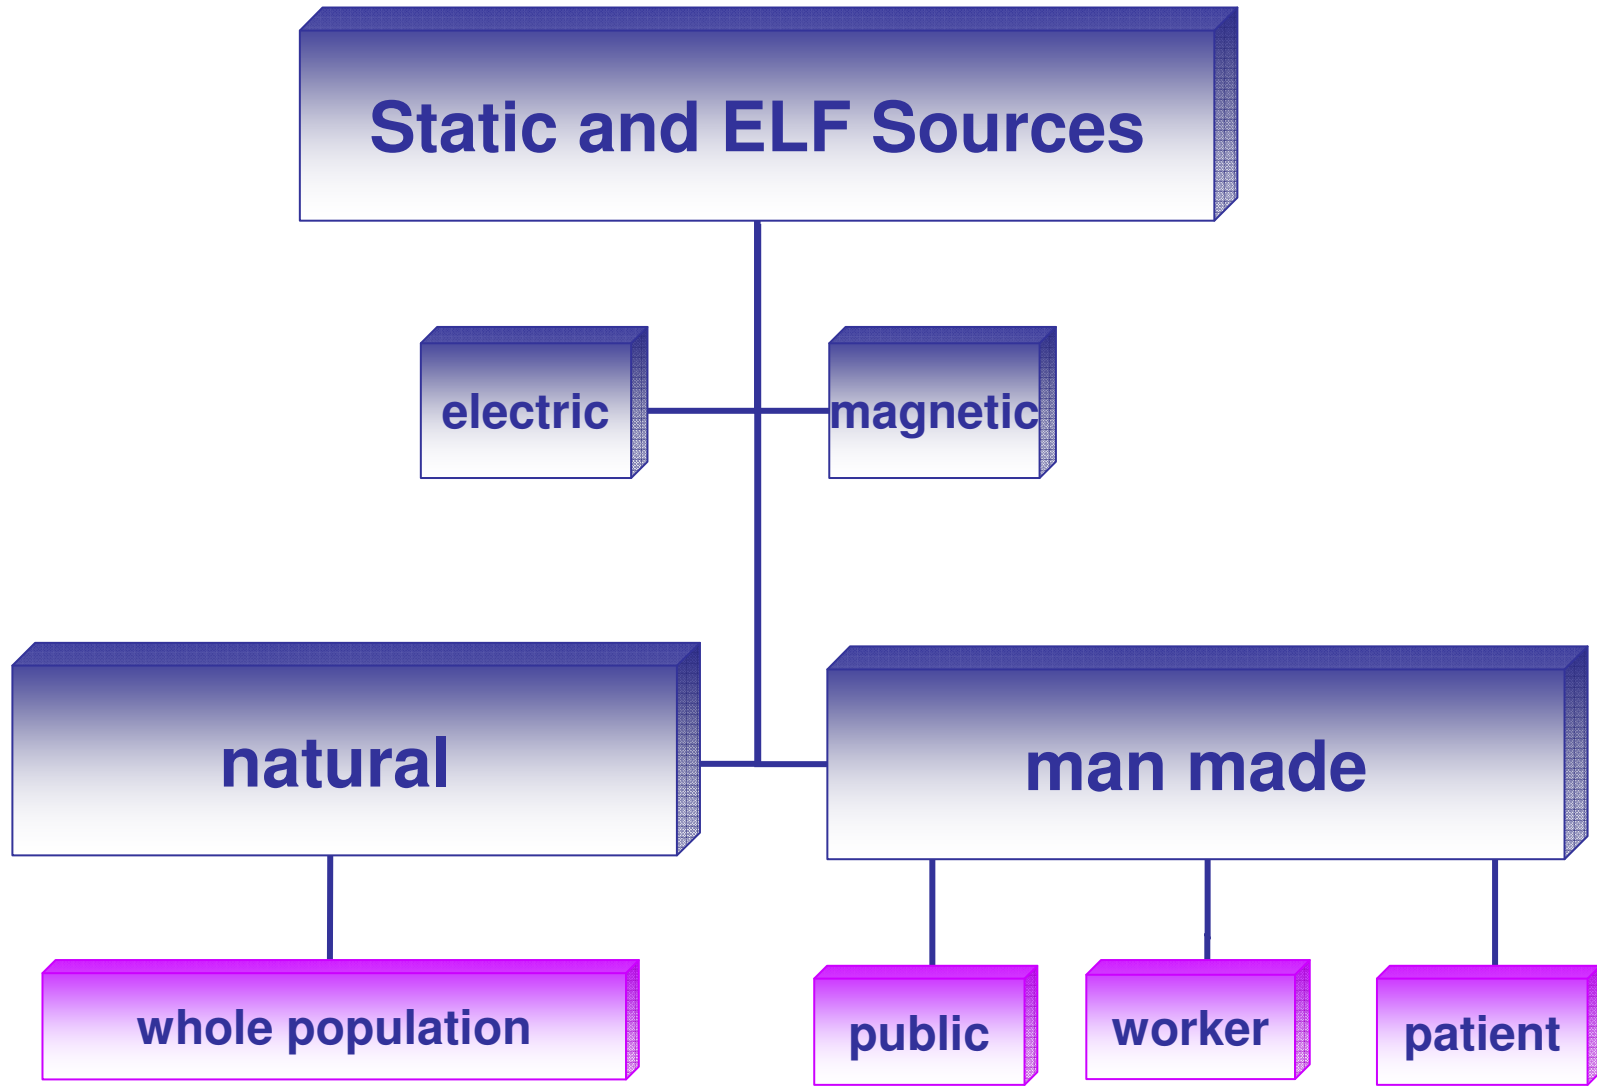

0 to 300 Hz

Slowly varying Fields	RF Fields	Optical Radiation
ELF   VF   VLF   LF	Radiowaves   Microwaves	IR   Light   UV

6<sup>th</sup> International NIR Workshop  
 October 14<sup>th</sup> to 17<sup>th</sup>, 2008, Rio de Janeiro, Brazil

**6<sup>th</sup> International NIR Workshop**  
**October 14<sup>th</sup> to 17<sup>th</sup>, 2008, Rio de Janeiro, Brazil**

# Characterising sources / exposures

- Electric field strength  $V\ m^{-1}$ ; magnetic field strength  $A\ m^{-1}$ ; magnetic flux density T; frequency Hz
- Fields are vector quantities (polarisation)
- Fields may have a complex time course (harmonics, transients)
  
- Fields decline with distance to the source
- Fields depend on actual operation conditions of the source
- Fields from different sources sum up in a complex way
- Fields depend on geometrical arrangements/design (e.g. power lines)
- Fields can be disturbed by the environment (especially E-fields)

**6<sup>th</sup> International NIR Workshop**  
**October 14<sup>th</sup> to 17<sup>th</sup>, 2008, Rio de Janeiro, Brazil**

# Natural sources

Nature/origin	Frequency (Hz)	Amplitude ( $\mu\text{T}$ )	Comment
Regular solar and lunar variations	$10^{-5}$	0.03-0.05 0.005-0.006	Increases in energy during summer and towards the equator
Irregular disturbances, e.g. magnetic storms	Wide range	0.8 – 2.4	27 day period (sun rotation)
Geomagnetic pulsations	0,002 - 5	$2 \cdot 10^{-5}$ - $8 \cdot 10^{-2}$	For moderate activities at mid latitudes
Cavity resonances	5 - 50	$2 \cdot 10^{-5}$ - $5 \cdot 10^{-5}$	Schumann resonance / lightning
Atmospherics	1-2 kHz	$5 \cdot 10^{-5}$	Lightning discharges, energy peak 100-200 Hz

# Man made sources

## Static electric fields

- Charge separation as result of friction
- Use of DC electric power

Walking on carpet	10 - 500 kV m <sup>-1</sup>	near the body
VDU	100 – 300 kV m <sup>-1</sup>	5 cm from screen
Treatment of plastics	several hundred kV m <sup>-1</sup>	near the body
HVDC line (500 kV)	20 kV m <sup>-1</sup>	below; 2 kV m <sup>-1</sup> in 400m
<b>Electric train systems</b>		
600 V systems	30 V m <sup>-1</sup>	5m from line
1 – 6 kV systems	300 V m <sup>-1</sup>	inside train

**6<sup>th</sup> International NIR Workshop**  
**October 14<sup>th</sup> to 17<sup>th</sup>, 2008, Rio de Janeiro, Brazil**

# Man made sources

## Static magnetic fields

fridge magnet

dental implant

necklace fastener

**Permanent magnets 1-2 T**  
Mechanical hazards  
Electromagnetic interference

magnetic bracelet

\* Magnetic blankets up to 50 mT at surface

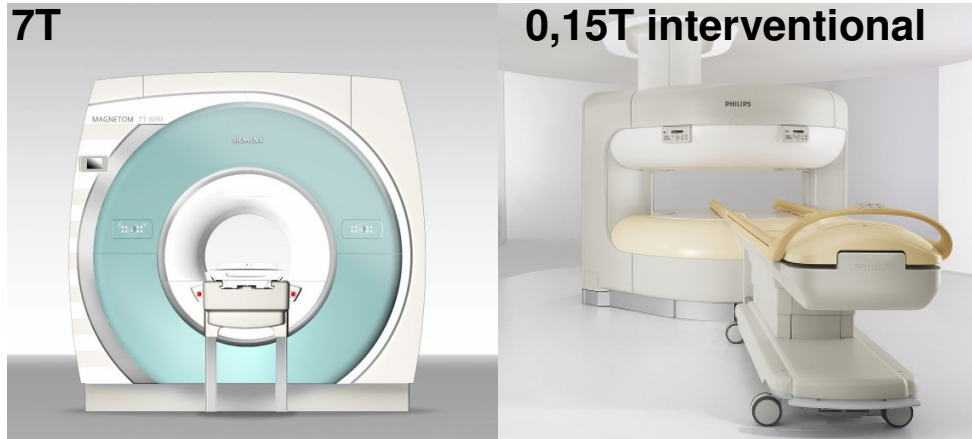

### Exposed:

- General public exposure → high but only local (e.g. hands)
- Occupational exposure → depending on the process
- Medical → high, local (anywhere inside the body)

# Man made sources

## Static magnetic fields

7T

Siemens 1,5 T

Most systems 1.5 T and less  
 Increasing routine use of 3T  
 Experimental systems up to 11.7 T

### Exposed:

- General public exposure → rarely
- Occupational exposure → up to 2 T  
     several hundred mT in general
- Medical (patient) → magnet field strength

1932

6<sup>th</sup> International NIR Workshop  
 October 14<sup>th</sup> to 17<sup>th</sup>, 2008, Rio de Janeiro, Brazil

# Man made sources

## Static magnetic fields

	Industry		Transport		Energy distribution
General public	(hobby)	few mT	Maglev	0,05 – 1000 mT	few tens of $\mu$ T
			Trains	0,1 – 1 mT	
			Tram	0,01 – 0,4 mT	
Occupational	Aluminium	< 60 mT	0,1 – 15 mT		50 mT
	Chlor-alkali	< 20 mT			
	Welding	< 5 mT			
	Heavy	< 0,2 mT			

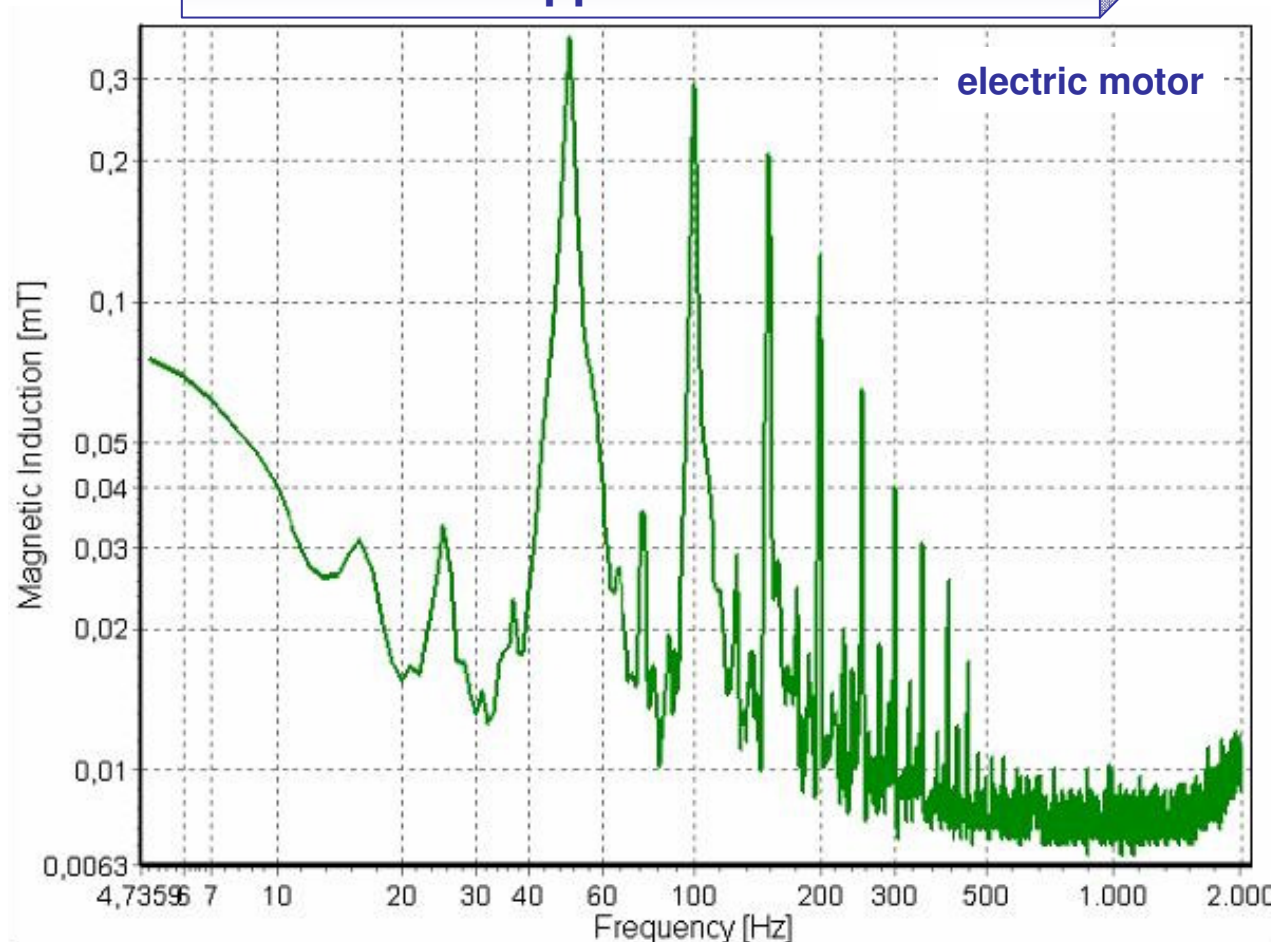

## ELF sources appliances

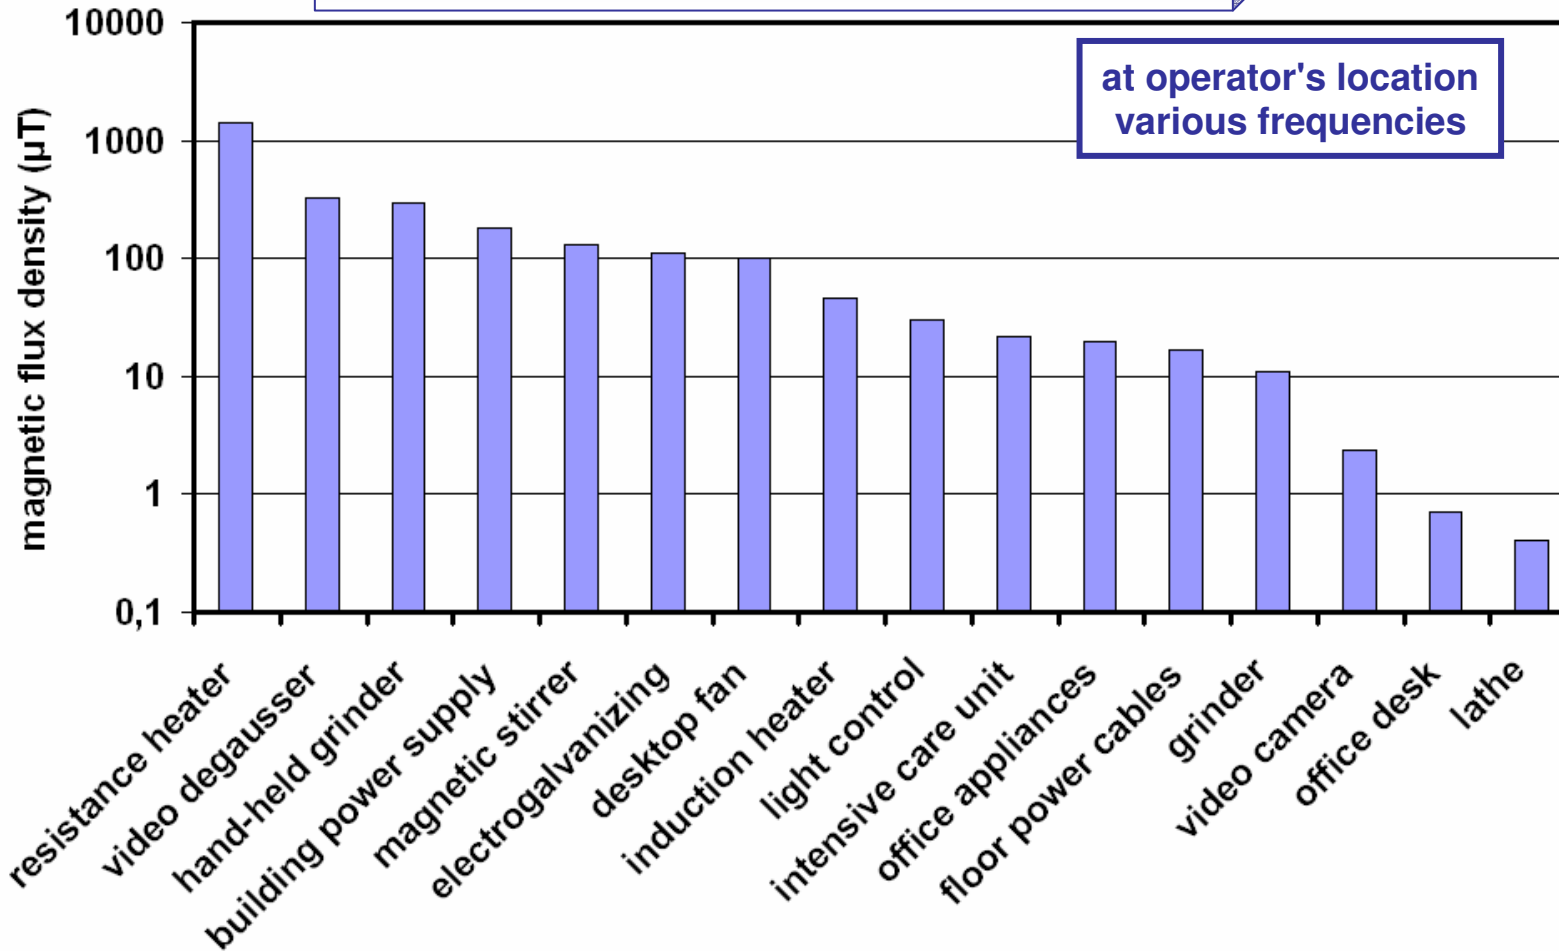

## ELF sources appliances

## ELF sources appliances

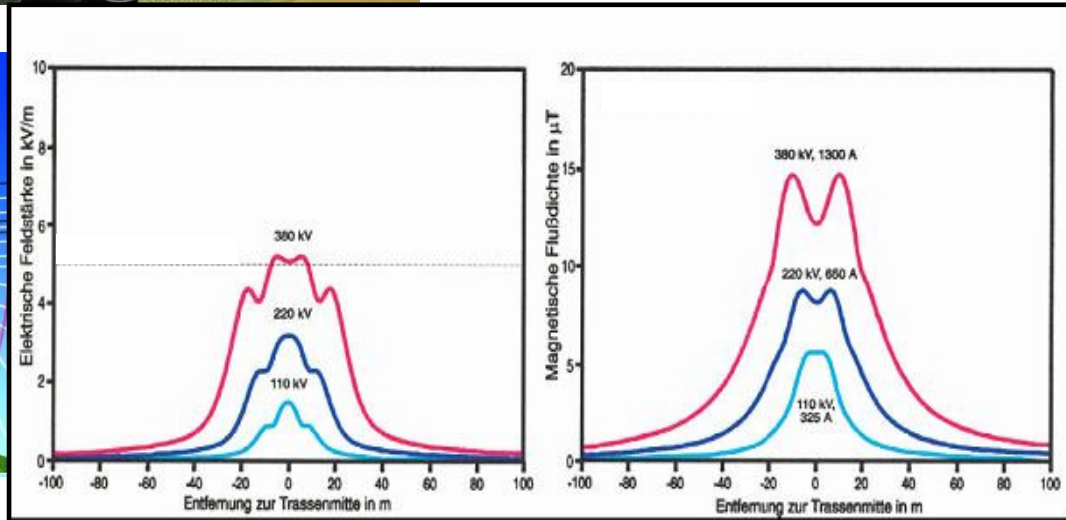

## ELF sources occupational equipment

# ELF sources

## electric power distribution

## ELF sources electric power distribution

Source	Typical electric field strength ( $\text{Vm}^{-1}$ )	Comment
Overhead power lines	1 000 – 10 000  up to 30 000	High exposure only outdoors below the line  Occupational (e.g. climbing a tower)
Underground cables	0	Usually screened
Substations	~ 0	Usually housed or fenced
House wiring	< 100	On average; very inhomogeneous
Outlet	700	On surface, 60V/m in 10 cm
Electro cable (2wire)	40	On surface of isolation

**6<sup>th</sup> International NIR Workshop**  
**October 14<sup>th</sup> to 17<sup>th</sup>, 2008, Rio de Janeiro, Brazil**

## ELF sources

### electric power distribution

Source	Magnetic flux density ( $\mu\text{T}$ )	Comment
<b>UK overhead transmission line</b>		
400 kV (2 kA)	40 (8)	beneath line (25 m lateral displacement)
275 kV (1 kA)	22 (4)	
<b>overhead distribution lines</b>		
132 – 11 kV	7	
415 V	1	
<b>US overhead transmission line</b>		
500 kV	18,3 (2,7)	beneath line (25 m lateral displacement)
230 kV	11,8 (1,5)	
115 kV	6,3 (0,4)	
<b>Substation</b>		
275 and 400 kV	10	at perimeter fence
11 kV	1,6	

**6<sup>th</sup> International NIR Workshop**  
**October 14<sup>th</sup> to 17<sup>th</sup>, 2008, Rio de Janeiro, Brazil**

# ELF sources

## electric power distribution

Voltage	Geometry of underground cable system	Typical magnetic flux densities 1 m above ground ( $\mu\text{T}$ )			
		0 m	5 m	10 m	20 m
400 / 275 kV	0.5 m spacing; 0.9 m depth	96	13	3.6	1
132 kV	0.3 m spacing; 1 m depth	9.6	1.3	0.36	0.1
132 kV	1 m depth	5	1.8	0.94	0.47
33 kV	0.5 m depth	1	0.29	0.15	0.07
400 V	0.5 m depth	0.5	0.14	0.07	0.04

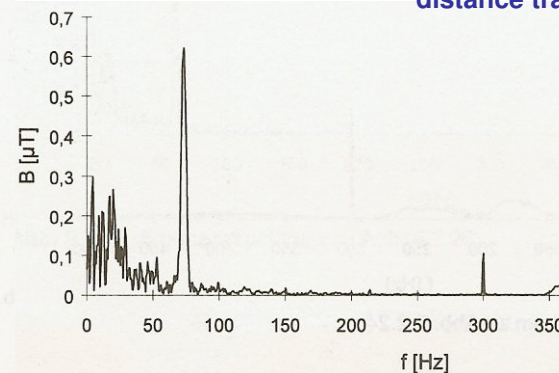

Verbund (Österreichische Elektrizitätswirtschafts-AG)

# ELF sources transport

<b>Suburban train UK</b> 100 Hz	up to 1 mT 16 – 64 $\mu$ T 16 – 48 $\mu$ T	floor level passenger on platform
<b>Mainline train</b>	up to 15 mT Up to 2,5 mT < 50 $\mu$ T	close to engine parts equipment car passenger coaches
<b>Long distance train, Finland</b> underground	0.3 – 290 $\mu$ T 10 – 6000 $\mu$ T up to 20 $\mu$ T	passengers Close to engine parts drivers cabin
<b>Local city line</b>	tens of $\mu$ T	on platform

Magnetic field close to rails for a German long distance train.

**6<sup>th</sup> International NIR Workshop**  
**October 14<sup>th</sup> to 17<sup>th</sup>, 2008, Rio de Janeiro, Brazil**

## ELF sources miscellaneous

Source	Magnetic flux density ( $\mu\text{T}$ )	Comment
Petrol engine devices	up to a few hundred	at operator's position
Mobile phones	50	at 1 cm
Cars	0.02 – 4 13	different locations peak
Tires	500 2	close to the tire inside car
EAS inside gate	146 93	73 Hz; EM; 31.5 cm 230 Hz; EM; 42 cm
Under floor heating	a few – a few hundred	depending on design
Induction hobs	a few	30 cm; up to 40 $\mu\text{T}$ in 1 cm 20-100 kHz

**6<sup>th</sup> International NIR Workshop**  
**October 14<sup>th</sup> to 17<sup>th</sup>, 2008, Rio de Janeiro, Brazil**

# ELF sources exposure

I general exposure result from use of electricity (50/60 Hz, etc.) but may contain harmonics, transients and other frequencies (occupational)

**Average electric fields in homes:**

$\approx 10 \text{ Vm}^{-1}$

**Local peak**

up to  $1000 \text{ Vm}^{-1}$

**Average magnetic fields in homes (geom. mean):**

Europe  $0,025 - 0,07 \mu\text{T}$

USA  $0,055 - 0,11 \mu\text{T}$

**local peak values**

several hundred  $\mu\text{T}$

**Average magnetic fields at workplaces depend strongly on the occupation**

electricians  $\approx 0,4 - 0,6 \mu\text{T}$

train drivers  $\approx 3 \mu\text{T}$

**Local peak values**

up to approx.  $10 \text{ mT}$

**6<sup>th</sup> International NIR Workshop**  
**October 14<sup>th</sup> to 17<sup>th</sup>, 2008, Rio de Janeiro, Brazil**

Bundesamt für Strahlenschutz

# Summary

- The dominant sources of exposure are man made.
- Static and ELF sources are associated with the generation, distribution and use of electricity.
- Since the use of electricity is an integral part of our modern lifestyle, power-frequency fields are ubiquitous in our environment.
- Special sources, in some workplaces and in medicine, use other frequencies
- Instantaneous magnetic-field values (close to sources) can be orders of magnitude higher than average values.
- Only few data exist on average residential exposure to electric fields.
- Average residential exposure to power-frequency magnetic fields does not vary dramatically across the world.
- The average exposure to magnetic fields in the workplace is job specific and has been found to be higher in “electrical” than in other occupations.

**6<sup>th</sup> International NIR Workshop**  
**October 14<sup>th</sup> to 17<sup>th</sup>, 2008, Rio de Janeiro, Brazil**

**Many thanks  
for your attention  
!!!**
